AIR PURIFIER

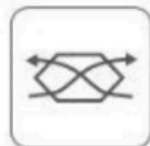

Intelligent control

Dual-pipe ventilation

Variable Frequency Motor

Graphene heat exchanger core

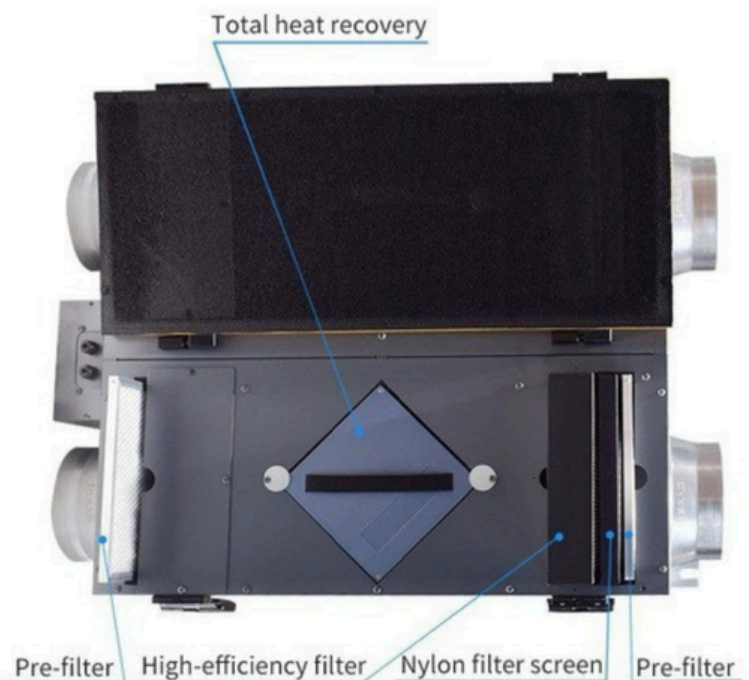

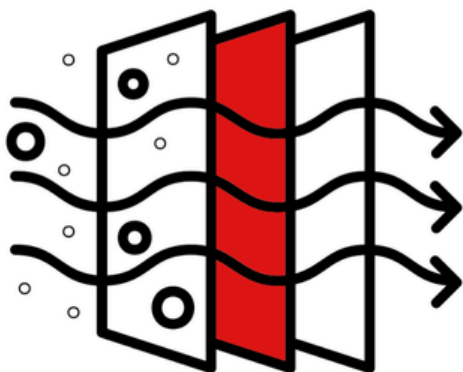

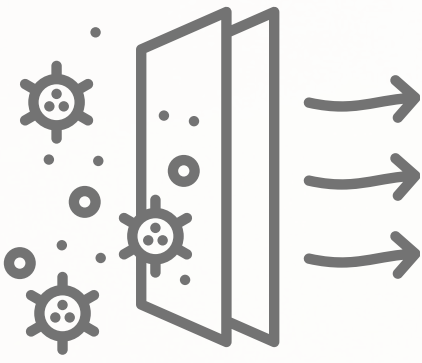

Air purification

OUR AIR PURIFIER REMOVES 99% POLLUTANTS, DUST AND ALLERGENS.

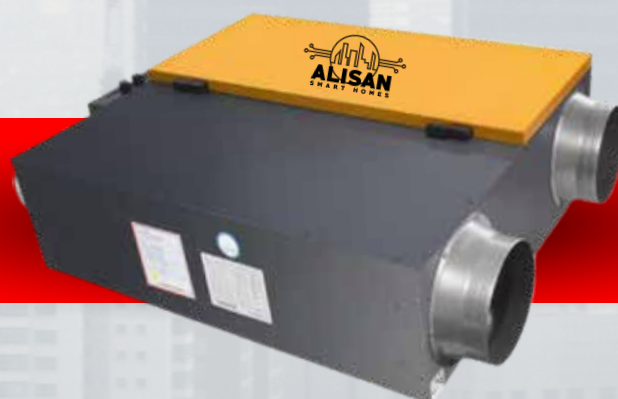

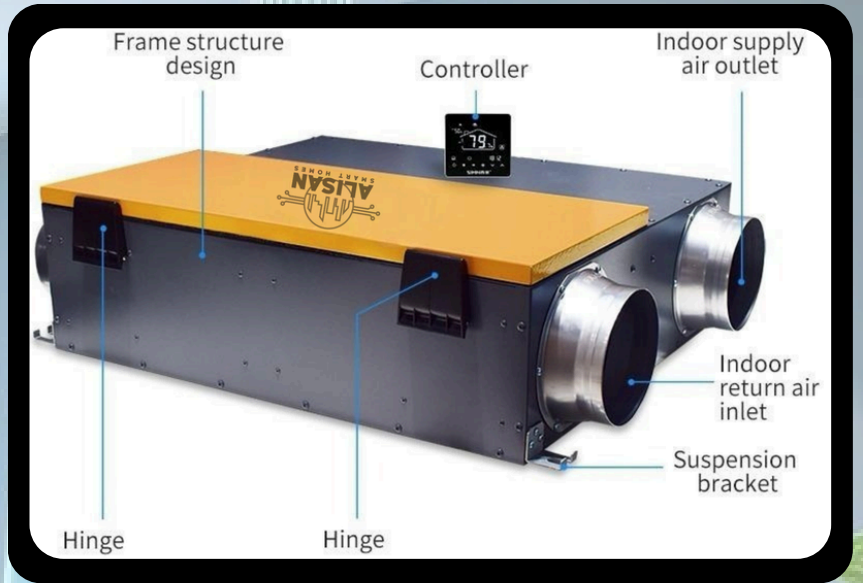

It has **dual pipe** ventilation. This means that it has two separate pipes that are used for distinct air or waste management functions.

- **Air purifiers** are designed to maintain clean indoor air by using a combination of filters and advanced technologies.
- They operate by drawing in polluted air from the surrounding environment, passing it through **multiple filtration layers** that capture impurities such as dust, pollen, mould spores, pet dander, and smoke particles.
- Once purified, the **clean air** is released back into the room. This process is continuous, ensuring that your indoor air remains **fresh** and **healthy**.

It has variable **frequency motor** and graphene heat exchanger core.
